GROUP INDIVIDUAL CONTRIBUTION REPORT

Mr. Kwadwo Osafo-Mafo

Team Members

Eldad Opare

Jerome Selorm Adedze

Marc Ettiene

Nongyin Sayinga Awindor

November 30, 2025

Our project brought together four team members who combined their strengths to create a collective and functional project. Although each of us had clear responsibilities, we constantly learned from one another and relied on teamwork to bring Bonten to life. This experience allowed us to grow not only as developers, but also as collaborators who understand the value of planning, communication, and consistency.

Jerome Adedze guided the entire visual direction of the project. Before any coding began, he created complete Figma designs for all the major pages, including the landing page, dashboard, and core user screens. His work served as the foundation for the rest of the team because the designs helped us understand exactly what each page should look like before development. To maintain structure and consistency, Jerome applied the Software Engineering Waterfall Method during the design phase. By following a clear sequence of requirement gathering, design, and validation before implementation, he ensured that the team started with a unified vision. This approach helped us avoid confusion later in the project and made the handoff from design to development much smoother. Jerome often reflected on how challenging it was to keep spacing and alignment consistent across different pages built by different developers. Yet these challenges deepened his appreciation for design discipline and made him more confident in turning visual concepts into a system the entire team could follow.

Nongyin Sayinga Awindor contributed as a frontend developer by converting the design files into fully functional pages. He built the user dashboard with structured layouts and implemented the templated event page, where JavaScript loads event information dynamically from JSON files. He reflected on how challenging it was to adjust from working alone to working within a shared codebase that required consistent formatting and careful version control. However, these experiences helped him develop confidence with Git and GitHub, and he learned how important it is for a team to constantly synchronize their work and communicate changes.

Marc-Etienne Sossou worked as a full-stack developer and helped the team make core technical decisions. He selected the technology stack, determined the payment infrastructure, and identified the hosting approach that would best support our system. His main contributions included integrating Paystack for secure ticket purchases, adding Cloudinary for image storage, and setting up an email notification system for ticket delivery. He faced difficulties with MySQL configuration on the school server and spent time testing multiple hosting options before finding a stable setup. Through these experiences, he learned how essential it is to plan early, communicate decisions clearly, and choose tools that fit the team's long-term goals.

Eldad Opare contributed as a full-stack developer and focused on the review system, event detail pages, and the database structure. He transformed static HTML and CSS pages into dynamic PHP pages connected to the database. He built endpoints for reviews and ratings, added authentication checks, and implemented logic to prevent users from performing duplicate actions. On the event detail pages, he created real-time ticket updates, automatic pricing calculations, and restrictions that disable bookings for past events. He also designed the relational database for users, events, reviews, RSVPs, and tickets. Eldad reflected that the most challenging part was managing edge cases and ensuring data integrity across multiple related tables. However, working through these challenges improved his understanding of backend logic, debugging, and creating user-friendly behavior.

Together, we combined design, frontend development, backend engineering, and system integration to build a complete and functional platform. This project strengthened our teamwork and taught us how planning, consistent communication, and a willingness to learn from one another can transform an idea into a working system.
