

Visual Design & System Diagrams

To complement the architecture of BONTEN, we created several visual representations that guided our design and development process. These diagrams illustrate the structure, flow, and interactions within the system, and provide a clear overview of how our platform functions.

1. Figma Designs

Our Figma prototypes showcase the user interface and user experience of BONTEN. They helped us plan layouts, interactions, and visual consistency across pages before development. The designs cover:

- User dashboards and event browsing pages
- Manager dashboards and event creation workflows
- Forms for registration, login, RSVPs, reviews, and comments

We used these designs as a reference throughout development, ensuring that the final interface is intuitive, responsive, and aligned with the user journey.

2. Page Flow Diagrams

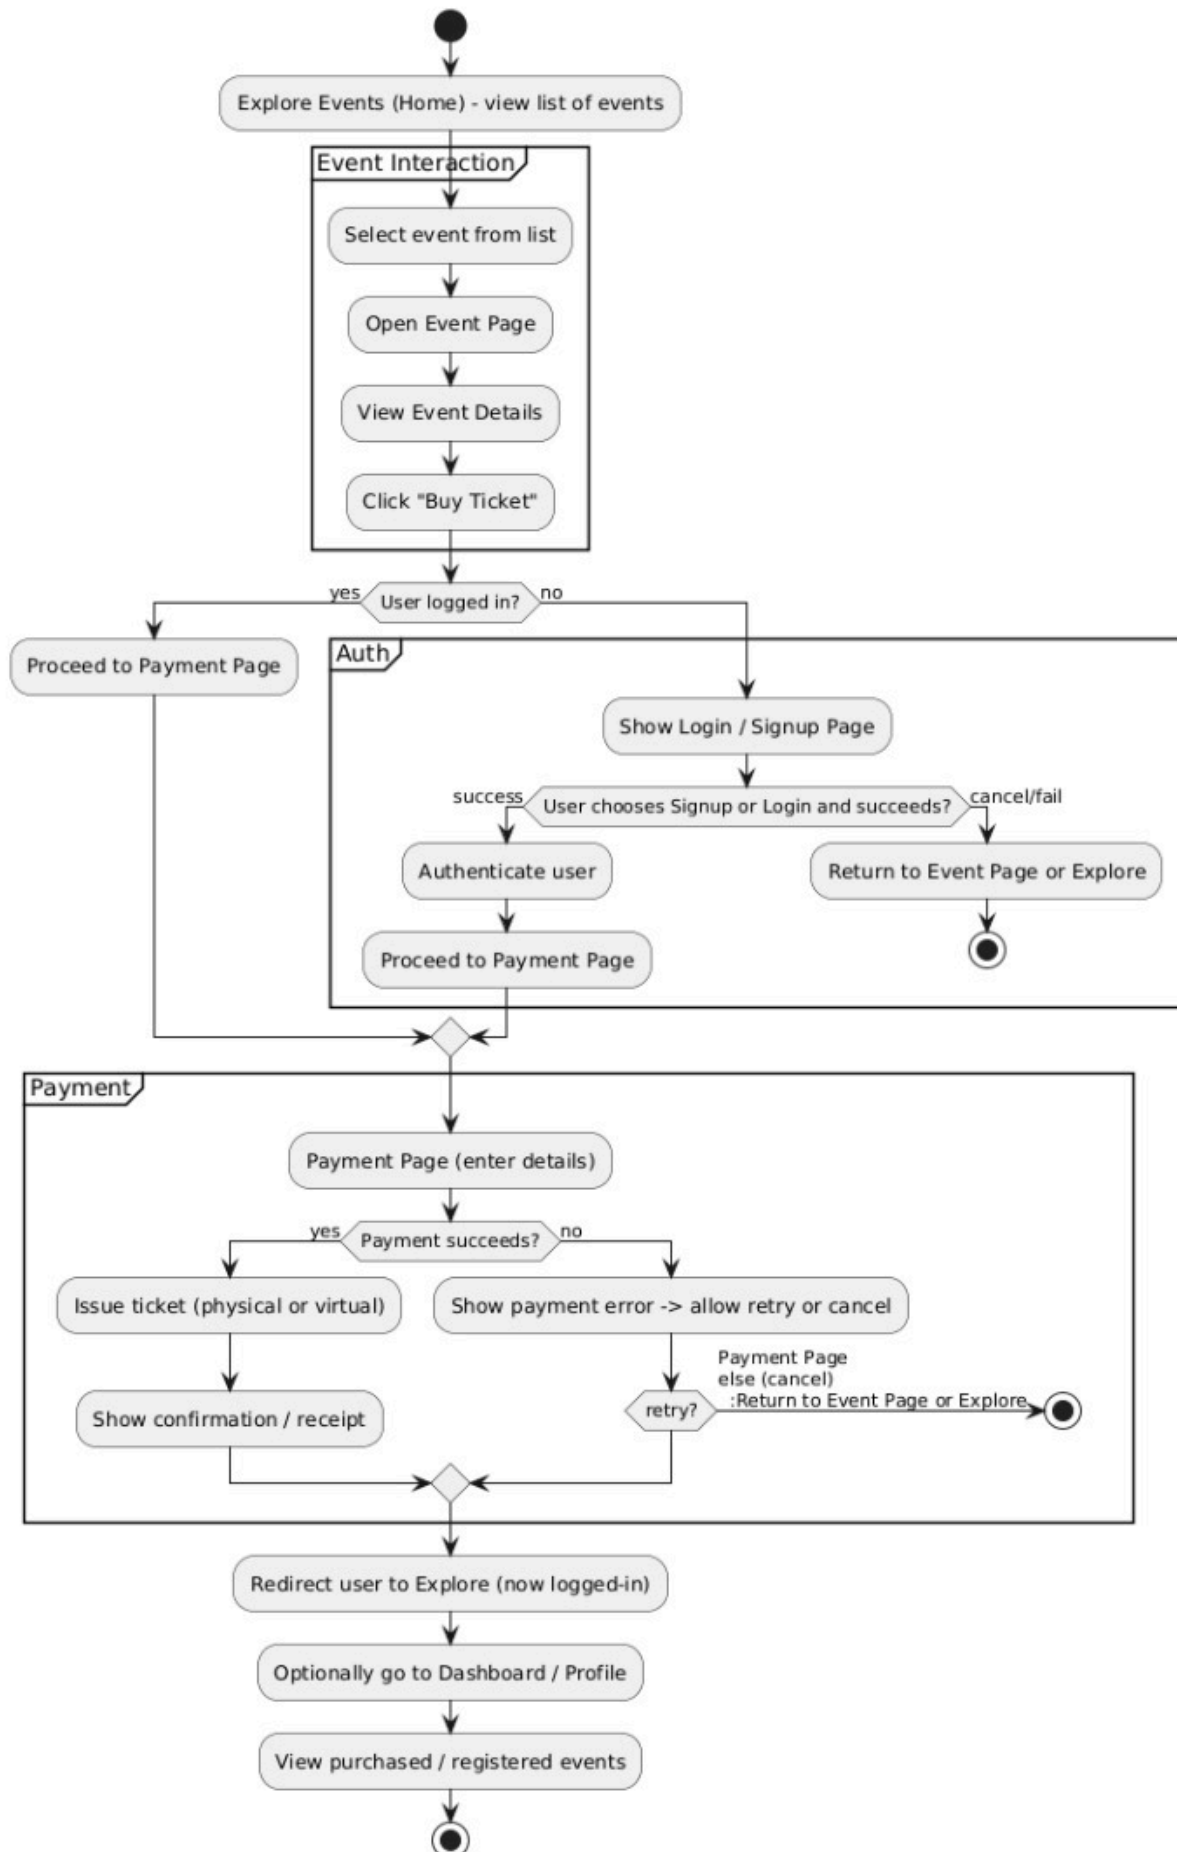

The page flow diagrams illustrate the navigation paths and interactions users can take within BONTEN. These diagrams helped us understand:

- How users move between pages (login → explore → event details → checkout)
- The sequence of multi-step processes, like event creation and payment
- Conditional flows, such as RSVP, review submission, and comment posting

They were instrumental in planning dynamic interactions and ensuring a smooth, coherent user experience.

User Page Flow

3. Entity-Relationship Diagrams (ERDs)

Our ER diagrams depict the data structure and relationships between entities in BONTEN's database. They provide a clear view of:

- Users, events, tickets, RSVPs, bookings, reviews, and comments
- Foreign key relationships and cascading rules
- How data integrity is maintained across operations

The ERDs were essential in designing the database schema and guiding implementation of CRUD operations while ensuring consistency.

ER diagram

4. Content Management System (CMS) Diagrams

The CMS diagrams outline how content and user actions are managed within BONTEN, showing:

- Controllers, APIs, and their responsibilities

- How dynamic content flows from the database to the user interface
- Integration points for payment, reviews, comments, and RSVPs

These diagrams provided our team with a clear map of system interactions, helping us coordinate development across modules efficiently.
